Claim 26; Pages 64-67; 123pp; English.

It may be used as part of a method of producing apomictic seeds comprising; (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity of the embryos ac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed apomixis allows plant breeders to develop cultivars with special stable traits for such characteristics as height, seed and forage quality and maturity.

This invention describes a method for conferring disease resists plants. The invention describes the use of novel genes and prote belonging to the Oryza longistaminata and Oryza sativa receptor kinase-like protein (RRK) Xa21 multigene family. Such genes from cassava, maize and tomato are also described. The genes and protesses are the control of th

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
         New receptor kinase Bin1 involved in brassinolide signalling useful for promoting increased yield and disease resistance in plants and for modulating occyte maturation plants and for modulating occyte maturation the plants and for modulating occyte maturation the plants of the plant steroid receptor kinase, the synthesis of the plant steroid hormone, brassinolide. 18 New Arabidopsis dwarf mutants were identified that lacked the ability to respond to brassinolide, and were named bin mutants. The bin1 mutations were used to map the gene to a small interval on Arabidopsis chromosome 4. Bin1 was choned by map-based cloning. The Bin1 polynucleotide was identified within this interval by sequencing the wild-type and mutant alleles of this nucleic acid. Overexpression of Bin1 in transgenic plants provides plants
                                                                                                                                                                                                                            W09859039-A1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            plant yield or vegetative biomass and increased seed yield. Expression of Bini may also increase resistance to pesticides. Inhibition of Bini may also increase resistance to pesticides. Inhibition of Bini, e.g. using antisense oligonucleotides (AON), is used to render plants male sterile, and to reduce their stature or yield, e.g. for creating dwarf varieties. Since Bini homologues may be involved in regulation of the menstrual cycle and uterine function, Bini, antibodies and AON may be useful as contraceptives, for improving success of in vitro fertilisation and to prevent premature labour. Transgenic animals are also provided, and are models for studying steroid-receptor interactions or can be used to screen for therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     to screen Sequence

This invention describes a method for conferring disease resistance in plants. The invention describes the use of novel genes and proteins belonging to the Oryza longistaminata and Oryza sativa receptor kinase-like protein (RRK) Xa21 multigene family. Such genes and proteins canssava, maize and tomato are also described. The genes and proteins can be used for enhancing resistance to Xanthomonas in a plant, preferably in

CDNA clones TRKI (T31307) and TRLI (T31308) were isolated from the conversation of tomato cDNA using primers (T31301-06) based on the crice disease resistance Xa21 gene (T31300). They belong to the RRK CC family of disease resistance genes. TRKI (tomato receptor kinase 1) is present as 1 or 2 copies in the tomato genome and 1 copy maps to the short arm of chromosome 1 in the proximity of a resistance gene to Xanthomonas campestris by vesicatoria RXI. It encodes an RKK CC transduction pathways leading to a defence response. The gene is cuseful for engineering disease resistance in tomato and other plants. SQ Sequence 1554 BP; 477 A; 303 C; 348 G; 426 T;

This invention describes a method for conferring disease resistance plants. The invention describes the use of novel genes and proteins belonging to the Oryza longistaminata and Oryza sativa receptor kinase-like protein (RRK) Xa21 multigene family. Such genes from cassava, maize and tomato are also described. The genes and protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1510

                       DNA encoding plant morphogenesis regulatory protein - useful yield plants with short stems or altered inflorescence claim 1; Pages 6-10; 17pp; Japanese.
The present sequence encodes an Arabidopsis thaliana plant morphogenesis regulatory protein (MRP), which can be used to a plant with, e.g. short stems or altered inflorescence. The acts on a plant at a specific site for a specific period, and therefore be used to regulate extraneous gene expression in a plant. The MRP's cDNA or genomic DNA can be used to transform plant to increase its MRP expression, and therefore control the plant to increase its MRP expression, and therefore control to the plant to increase its MRP expression, and therefore control to the plant to increase its MRP expression.
                                                                                                                                                                                                                                                                                                                           24-AUG-1995; JP-216187.

Clas I S-receptor kinase (SRK) g
Class I S-receptor kinase; SRK;
                                                                                       S-locus glycoprotein gene - and S receptor kinase gene of c
type and class II type to produce recombinant plants
Disclosure; Fig 2; 20pp; Japanese.
The present sequence represents a class I S-receptor kinase
gene. The sequence was isolated from Brassica camestris S45
Sequence 2640 BP; 800 A; 491 C; 645 G; 704 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2589

These genes are transcribed specifically in pistils and anthers and are involved in the stigmatic self-incompatibility (SI) response of Brassica. The protein products of these genes are thought to be the primary transmitters of the pollen recognition signal in the SI response. The SRK proteins comprise an S-locus binding domain, a transmembrane domain and a protein kinase domain. The S-locus binding domain is pref. substantially homologous to an S-locus glycoprotein (SIG) gene. The kinase domain has a degree of homology with the kinase domain of SRK6, SRK2, and ZMPKI.

CDNA clone SRK-A10 (T13425) codes for an S locus receptor kinase associated with the A10 self-incompatability allele of Brassica napus. It was isolated from genomic DNA of rapeseed line W1 by PCR amplification. The gene contains a 1 bp deletion resulting in premature termination of translation and prodn. of truncated SRK-A10 protein. Expression vectors contg. a corrected SRK-A10 gene (see T13423) are used to produce self-incompatible plants able to produce hybrid seed in improved yields.

Claim 94 Self-incompatability allele of Brassica napus. The gene contains a 1 bp deletion resulting in premature termination of translation and prodn. of truncated SRX-Al0 protein. A 'corrected' gene (T13423) has a, c or g inserted at position 948 (T13423). Incorporation of the corrected gene into an expression vector allows the breeding of self-incompatible plants able to produce hybrid seed in improved yields. Sequence 24, Application US/08587680A
Patent No. 5977434

GENERAL INFORMATION:
APPLICANT: Wang, Guo-Liang
APPLICANT: Scab, Veronique
TITLE OF INVENTION: Procedures and Materials for Conferring
APPLICANT: Scab, Veronique
TITLE OF INVENTION: Disease Resistance in Plants
NUMBER OF SEQUENCES: 27
CORRESPONDENCE ADDRESS:
ADDRESSE: Townsend and Townsend and Crew LLP
STREET: Two Embarcadero Center, Eighth Floor
CITY: San Francisco
STATE: Galifornia
COUNTRY: USA
ZIP: 94111-3834
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: Insh PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/587,680A
FILING DATE: 17-JAN-1996
CLASSIFICATION NUMBER: US 08/475,891
FILING DATE: 17-JAN-1995
PRIOR APPLICATION DATA:
APPLICATION NUMBER: US 08/475,891
FILING DATE: 07-JUN-1995
PRIOR APPLICATION DATA:
APPLICATION NUMBER: US 08/567,375
FILING DATE: 29-SEP-1995
PRIOR APPLICATION DATA:
APPLICATION NUMBER: US 08/567,375
FILING DATE: 29-SEP-1995
PRIOR APPLICATION NUMBER: US 08/567,375
FILING DATE: 104-DEC-1995
ATTORNEY/ACENT INFORMATION:
NAME: Bastian, Kevin L.
REGISTRATION FOR SEQ ID NO: 24:
SEQUENCE CHARACTERISTICS:
